Sample DSP Objective Questions and Detailed Answers

Below is a curated list of representative questions with comprehensive explanations, designed to demonstrate the depth and variety of DSP objective questions.

Question 1: Which of the following is an example of a linear time-invariant (LTI) system?

A) A system where the output is proportional to the input, but only for a limited time.

B) A system where shifting the input signal in time results in an identical shift in the output.

C) A system with outputs that depend on the square of the input.

D) A system that amplifies certain frequencies selectively.

Answer: B) A system where shifting the input signal in time results in an identical shift in the output.

Explanation:

A system is said to be linear if it satisfies superposition (additivity and homogeneity), and time-invariant if a shift in the input causes an identical shift in the output without altering the system's characteristics. Option B describes the fundamental property of time invariance, making it the correct answer. Option A describes limited-time systems, which are not necessarily time-invariant. Option C involves non-linearity, and Option D pertains to filtering characteristics, not system linearity

or time invariance.

Question 2: The Fourier Transform of a real-valued, even signal is:

A) Real and odd.

B) Complex and odd.

C) Real and even.

D) Complex and even.

Answer: C) Real and even.

Explanation:

For a real-valued, even signal $x(t)$, its Fourier transform $X(f)$ is also real and even. This stems from the symmetry properties of Fourier transforms:

- If $x(t)$ is real and even, then $X(f)$ is real and symmetric about the frequency axis.
- The Fourier transform of an even function is real and even, while that of an odd function is imaginary and odd. Hence, option C is correct.

Question 3: The Z-transform of the sequence $x(n) = a^n u(n)$, where $u(n)$ is the unit step, is:

A) $\frac{1}{1 - a z^{-1}}$

B) $\frac{z}{z - a}$

C) $\frac{1}{1 - a z}$

D) $\frac{z}{z - a}$

Answer: D) $\frac{z}{z - a}$

Explanation:

The Z-transform of $x(n) = a^n u(n)$ is given by:

$$

$$X(z) = \sum_{n=0}^{\infty} a^n z^{-n} = \sum_{n=0}^{\infty} \left(\frac{a}{z}\right)^n = \frac{1}{1 - \frac{a}{z}} = \frac{z}{z - a}$$

valid for $|z| > |a|$. Therefore, option D is correct.

Question 4: Which filter type is characterized by having a linear phase response?

A) IIR filter

B) FIR filter

C) Both IIR and FIR

D) Neither IIR nor FIR

Answer: B) FIR filter

Explanation:

Finite Impulse Response (FIR) filters can be designed to have a linear phase response, which ensures that all frequency components are delayed equally, avoiding phase distortion. IIR filters generally do not have linear phase unless specifically designed with special structures, and even then, linear phase is not guaranteed. Therefore, FIR filters are typically associated with linear phase characteristics, making option B correct.

Question 5: The Nyquist frequency is:

A) Half of the sampling frequency.

B) The maximum frequency that can be accurately sampled.

C) Both A and B.

D) The minimum frequency required for sampling.

Answer: C) Both A and B.

Explanation:

The Nyquist frequency is defined as half of the sampling frequency (\(f_s/2\)). It represents the highest frequency component that can be accurately reconstructed from sampled data without aliasing. This is fundamental in sampling theory, making options A and B both correct.
